

**In the Specification**

Please insert the following paragraphs on page 8 before the paragraph beginning on line 20:

In a preferred embodiment, an immunostimulatory oligonucleotide is synthetic, between 2 to 100 base pairs in size and contains a consensus mitogenic CpG motif represented by the formula:

wherein C and G are unmethylated,  $X_1$ ,  $X_2$ ,  $X_3$  and  $X_4$  are nucleotides and a GCG trinucleotide sequence is not present at or near the 5' and 3' termini.

For facilitating uptake into cells, CpG containing immunostimulatory oligonucleotides are preferably in the range of 8 to 40 base pairs in size. Prolonged immunostimulation can be obtained using stabilized oligonucleotides, particularly phosphorothioate stabilized oligonucleotides. Enhanced immunostimulatory activity has been observed where  $X_1 X_2$  is the dinucleotide GpA and/or  $X_3 X_4$  is the dinucleotide is most preferably TpC or also TpT. Further enhanced immunostimulatory activity has been observed where the consensus motif  $X_1 X_2 \text{ CG } X_3 X_4$  is preceded on the 5' end by a T.
